

Login Page Type Tutorial

To add a Login page to the resources of your app you can do the following: go to your app's *Dashboard* → *Edit Pages* → + *Add New Page*. In the menu of all our page types select Login and click Create.

Login page editing options are available only to the designers of an app. So if you decide that users should be able to register their own accounts in your app, you will have to provide them their credentials, namely login and password.

The screenshot displays a user management interface. At the top, there are two buttons: a green "Save" button and a grey "Done" button. Below them, a text instruction reads: "To add a new user click '+' button below the list. To delete an user, select it and click '-' button." The main area is titled "Users:" and contains a list with one entry, "Alex", which is highlighted in blue. Below the list are four control buttons: a plus sign (+), a minus sign (-), an up arrow (▲), and a down arrow (▼). Below this section, another text instruction reads: "For selected user above you can change its login, password and target url." The bottom section is titled "Users Properties" and contains three input fields: "Login:" with the value "Alex", "Password:" with the value "p455w0rd", and "Target:" with a dropdown menu showing "Podcast.html".

To add a new user account to your app click on the + at the bottom of the list of all users. In the window just below provide login and password for the user as well as a target page of your app to which he or she will be redirected after successful logging in.

For example the picture above represents credentials of the user "Alex" who's password is "p455w0rd". He will be redirected to a page called Podcast.html which other users might not have a right to access.
