

## Notifications Page Type Tutorial

Apple has introduced its Push Notifications service in 2009 with the announcement of iOS 3. Seattle Clouds' online application editor allows its users, apart from enabling push notifications in their apps, to create a special page where one can go through all the received push notifications.

To add a Notifications page type to your application go to the app's *Dashboard* → *Edit Pages* → + *Add new Page*. The menu of all our page types will appear:

Select Notifications page type and click *Create*.

Notifications page type has no page-specific editing options, just a standard set of customizations like transitions and advertisement banner positioning.

Before previewing this page, please add in app resource manager a push messages separator image. The separator should be named "line.png".

**Note:** Notifications page type must be marked for sync in the app's resource manager.
