

## WebKit Details page - Tutorial

WebKit Details type pages share the rounded corner design with webkit menu pages and can be used for displaying content like text, images and links. Pages are edited using a WYSIWYG interface web editor.

Editing is done in the page Edit HTML Page:

**Edit HTML Page**

WebKitDetails.html

This is an HTML page. To convert this page to a different type click [Convert Page](#).

**DRAG / MOVE Page Elements.**

To change PAGE STYLE click [HERE](#).

Top Banner:  AdMob  IAd  None  
Bottom Banner:  AdMob  IAd  None

Transition:  Slide  Curl  Flip  None

Slide to Next Page:  
(none)

**Slide**

Select a next page if you want to enable slide navigation. Slide Left will bring up next page. Slide right will go back.

**Resource Manager**

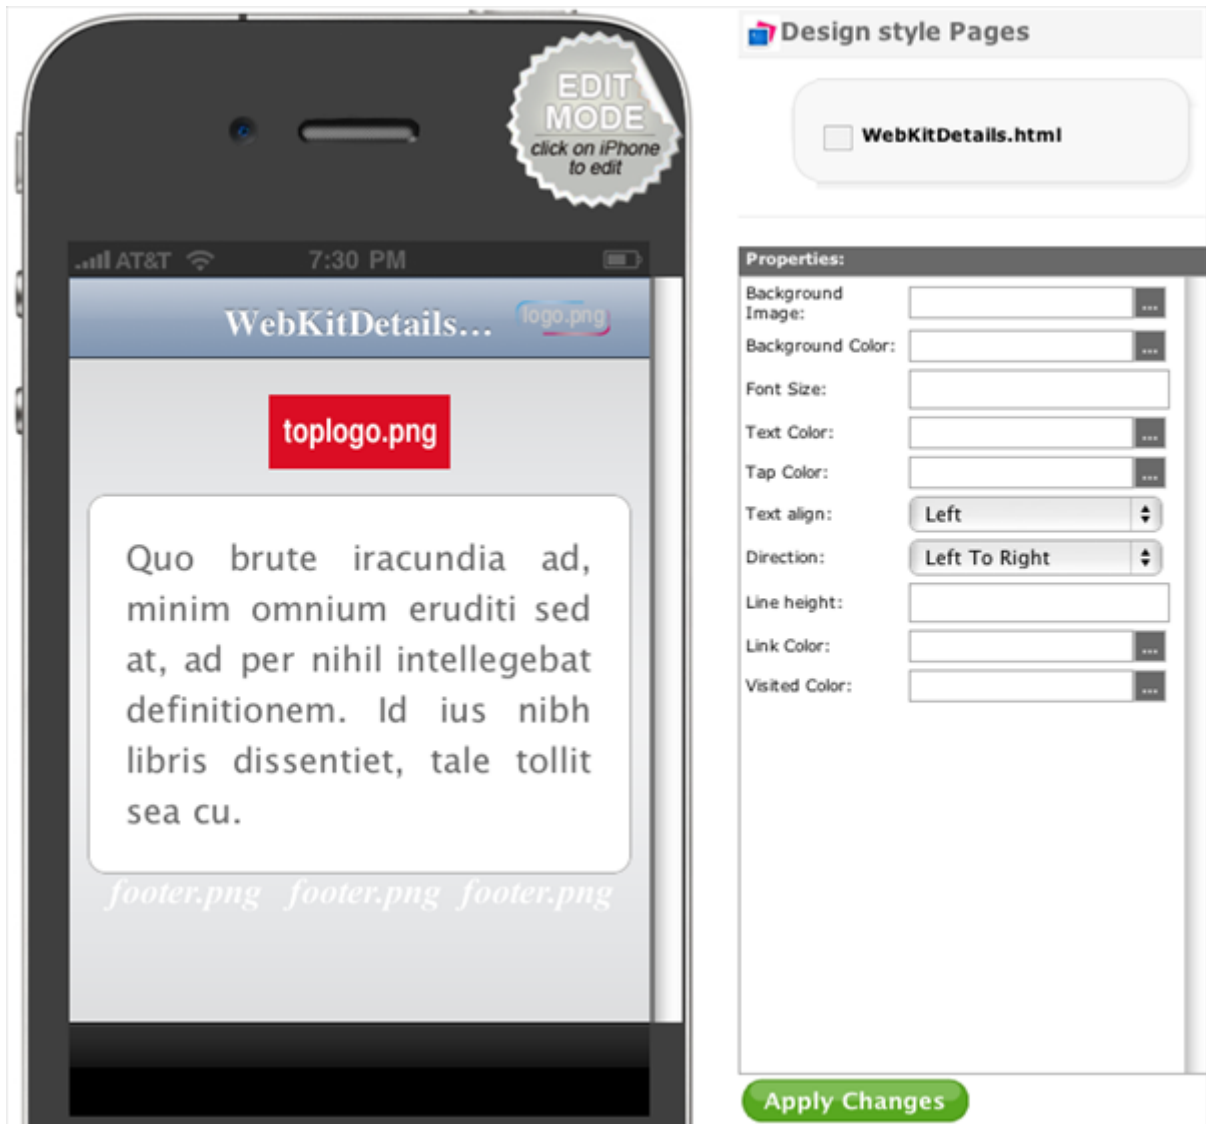

To start editing, click on iPhone surface and start typing. Select the text and press Delete or Backspace to erase it. Use the toolbox on the left to format the text, add links, insert pictures or media files.

In the Edit Menu Page you can customize:

1. Title text displayed on the top of page;
2. Replace the “toplogo.png” image. New image can be selected in the Gallery or uploaded to your app's folder via the Resource Manager;
3. Replace footer image;
4. Enter and format content (text, images, links) using the ToolBox.

Also a transition method to the next page can be selected (slide, curl).

The style of each WebKit Details page can be customized from within Design style Pages:

You can specify background image/color, text color/align, etc for each page.

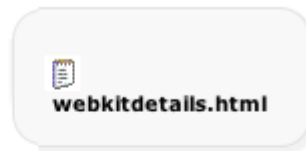

In order to customize header of the page you will have to edit the style.css. Click on the Edit "style.css" link from the Design Properties page.

To determine the class of the elements in your page, switch to HTML mode and search in the code for a class selector or html tag related to the element (text, image, background) you want to customize.

Done

For instance, cascading style of the header (background, title and logo.png image) on WebKit Details pages is defined by the class "toolbar" and tags <div> and <h1>. Thus editing in style.css the values of properties listed in:

```
1 body > div.toolbar
```

and

```
1 .toolbar > h1
```

will change the style of all headers on this type of pages in your app.
